

I used to work for a power company and know that complaints about radio interference from power lines got a very low priority. Many times I talked to the group that would be told to check them out and was told that they were told to try to do what they could to smooth the problem over instead of fix them. It was not cost effective to send a crew out to clean insulators, or tighten loose connectors when the person could be told that they would get to them latter but no one would really show up until there was a lot of complaints in the area instead of just a few.

If Broadband over the Power Line is adopted it will be much the same, try to cover it up instead of fix it. Please do not allow this to happen.
